

1, Explain behaviour of hub device

Hub is a layer 1 device that does multiple network device connection without any MAC and IP. Its only function is broadcast. due to broadcast collision occur. To overcome collision, we using half duplex in hub.

2, Explain behaviour of switch device

It is a layer 2 device. broadcast device. It contain MAC table, act as broadcast + unicast and also ~~MAC~~.
2nd time the switch check the data under the MAC table then unicast box to switch overcome broadcast collision.

3, Explain behaviour of router device

It is layer 3 device. It contain routing table, and has routing table contain list of routing.

- * It will break the broadcast domain ~~connect~~ ^{blw switch}
- * use to connect different network ^{and router}
- * routing table contain
 netw ID, prefix length, interface name.
