

1, Explain uses of ping command in network ?

ping is network troubleshooting command used to check where one device can reach another device over a network. using ICMP it checks connectivity, IP config and packet loss.

2, Explain netbios protocol ?

net BIOS (network Basic Input/output system) is a networking interface (protocol) used by windows computers to communicate with each other on local network, computer names to IP address, sends connectionless message, manage communication session b/w computers.

3, Explain SMB protocol ?

SMB (Server Message Block) is a network protocol used mainly to share files, folders, printers and other resources b/w computers over a network. Authentication and access control, file operations such as read, write, create and delete.

4, Explain ping process from 50.0.0.10 to 50.0.0.20 ?

ping from 50.0.0.10 to 50.0.0.20, the source device first checks whether the destination is in same network. To learn addressing learning prot no and destination mac. To learn destination mac using ARP table. Then it sends an ICMP echo Request through the switch. The destination receives it and sends an ICMP echo reply back. If the reply reaches the source, the ping is successfully executed. we verify IP config command also.
